

A Falcon's Journey

Help Nadya on her first migration to her new winter home.

Many peregrine falcons migrate several hundred miles from where they hatched. They migrate so they can find a home of their own, away from their parents and siblings. Peregrines often follow rivers on their migration journey because there is a lot of prey available near rivers.

A Falcon's Journey

Help the peregrine find its way back home to Mayo Clinic.

MAZE
#2

START

FINISH

Sometimes peregrine falcons migrate extreme distances to find another place to live in the winter where food is more plentiful, and the weather is warmer. By late February, peregrine falcons have claimed Mayo Clinic as their territory and start getting ready to lay eggs and raise a family.

What's on the Menu?

Help the peregrine catch its next meal.

Peregrine falcons are built for speed, sometimes flying over 200 miles an hour to catch their prey. Peregrines will sometimes circle high above their prey before going into a stoop or dive to catch their quarry, like pigeons, ducks and other types of birds. Despite their great speed, peregrines are not successful every time they go hunting.

Help the Falcon Find a Home

Help the peregrine find a new territory to raise its family.

START

FINISH

Until they became endangered in the mid-1950's, most peregrine falcons chose their territory on top of a high cliff near rivers or oceans. Today, peregrine falcons may have a territory in the middle of a large city on a tall building, on the top of a smokestack at an energy plant or underneath a bridge crossing a river.

Peregrine falcons typically eat other birds like pigeons, ducks and songbirds. They've been known to eat birds as small as hummingbirds or as large as cranes! Peregrines rarely eat mammals like rabbits and squirrels.

A-maze-ing Adventure

Peregrine falcons can nest on towers, bridges and tall buildings such as at Mayo Clinic in downtown Rochester, MN. Historically, peregrines nested on high cliffs near water.
